

## Lecture 3: What is a System

K S Rajan  
IIIT Hyderabad

4<sup>th</sup> Jan 2012

- WHAT a system is;
- WHO its users and stakeholders are;
- WHY it exists and HOW it benefits its users and stakeholders;
- HOW it is structured; and HOW it operates, is supported, and disposed.

## What is a System ?

- a system is a dynamic and complex whole, interacting as a structured functional unit;
- energy, material and information flow among the different elements that compose the system;
- a system is a community situated within an environment;
- energy, material and information flow from and to the surrounding environment via semi-permeable membranes or boundaries;
- systems are often composed of entities seeking equilibrium but can exhibit oscillating, chaotic, or exponential behavior.
- A holistic system is any set (group) of interdependent or temporally interacting parts. *Parts* are generally systems themselves and are composed of other parts, just as systems are generally parts or *holons* of other systems.

## What is a System?

- An integrated set of interoperable elements, each with explicitly specified and bounded capabilities, working synergistically to perform value-added processing to enable a User to satisfy mission-oriented operational needs in a prescribed operating environment with a specified outcome and probability of success.

## Examples of Systems

- |                             |                              |
|-----------------------------|------------------------------|
| • Economic systems          | • Communications systems     |
| • Educational systems       | • Entertainment systems      |
| • Financial systems         | • Government systems         |
| • Environmental systems     | Legislative systems          |
| • Medical systems           | Judicial systems             |
| • Corporate systems         | Revenue systems              |
| • Insurance systems         | Taxation systems             |
| • Religious systems         | Licensing systems            |
| • Social systems            | Military systems             |
| • Psychological systems     | Welfare systems              |
| • Cultural systems          | Public safety systems        |
| • Food distribution systems | Parks and recreation systems |
| • Transportation systems    | Environmental systems        |

- System
  - A combination of human, products and tools
- Product
  - is typically a physical device or entity that has a specific capability—form, fit, and function—with a specified level of performance.
  - *Products* generally lack the ability (*intelligence*)
  - Contextually, however, a product may actually be a vendor's "system" that is integrated into a User's higher-level system. Effectively, you create a system of systems (SoS).
- Tools
  - a supporting product that enables a user or *system* to leverage its own capabilities and performance to more effectively or efficiently achieve mission objectives that exceed the individual capabilities of the User or system.

## Representation of a System

Figure 3.1 Basic System Entity Construct

## An Analytical view

Figure 3.2 Analytical System Entity Construct

## ILEAPS

Focus 2: Feedbacks between land biota, aerosols, atmospheric composition and climate

## ILEAPS

Focus 2: Perturbations by human activities

- Workflow based Systems
  - Schools, hospitals, banking, manufacturing, etc
- Complex, Multi level systems
  - Analyze
  - Design
  - Develop
- Application of analytical, mathematical, and scientific principles are needed
